

Determine the minimum cost to provide library access to all citizens of HackerLand. There are  $n$  cities numbered from  $1$  to  $n$ . Currently there are no libraries and the cities are not connected. Bidirectional roads may be built between any city pair listed in *cities*. A citizen has access to a library if:

- Their city contains a library.
- They can travel by road from their city to a city containing a library.

### Example

The following figure is a sample map of HackerLand where the dotted lines denote possible roads:

```
c_road = 2
c_lib = 3
cities = [[1, 7], [1, 3], [1, 2], [2, 3], [5, 6], [6, 8]]
```

The cost of building any road is  $cc\_road = 2$ , and the cost to build a library in any city is  $c\_lib = 3$ . Build  $5$  roads at a cost of  $5 \times 2 = 10$  and  $2$  libraries for a cost of  $6$ . One of the available roads in the cycle  $1 \rightarrow 2 \rightarrow 3 \rightarrow 1$  is not necessary.

There are  $q$  queries, where each query consists of a map of HackerLand and value of  $c\_lib$  and  $c\_road$ . For each query, find the minimum cost to make libraries accessible to all the citizens.

### Function Description

Complete the function *roadsAndLibraries* in the editor below.  
*roadsAndLibraries* has the following parameters:

- *int n*: integer, the number of cities
- *int c\_lib*: integer, the cost to build a library
- *int c\_road*: integer, the cost to repair a road
- *int cities[m][2]*: each *cities[i]* contains two integers that represent cities that can be connected by a new road

### Returns

- *int*: the minimal cost

### Input Format

The first line contains a single integer  $q$ , that denotes the number of queries.

The subsequent lines describe each query in the following format:

- The first line contains four space-separated integers that describe the respective values of  $n$ ,  $m$ ,  $c_{lib}$  and  $c_{road}$ , the number of cities, number of roads, cost of a library and cost of a road.
- Each of the next  $m$  lines contains two space-separated integers,  $u[i]$  and  $v[i]$ , that describe a bidirectional road that can be built to connect cities  $u[i]$  and  $v[i]$ .

### Constraints

- $1 \leq q \leq 10$
- $1 \leq n \leq 10^5$
- $0 \leq m \leq \min(10^5, \frac{n \cdot (n-1)}{2})$
- $1 \leq c_{road}, c_{lib} \leq 10^5$
- $1 \leq u[i], v[i] \leq n$
- Each road connects two distinct cities.

### Sample Input

STDIN	Function
-----	-----
2	<code>q = 2</code>
3 3 2 1	<code>n = 3, cities[] size m = 3, c_lib = 2, c_road = 1</code>
1 2	<code>cities = [[1, 2], [3, 1], [2, 3]]</code>
3 1	
2 3	
6 6 2 5	<code>n = 6, cities[] size m = 6, c_lib = 2, c_road = 5</code>
1 3	<code>cities = [[1, 3], [3, 4], ...]</code>
3 4	
2 4	
1 2	
2 3	
5 6	

### Sample Output

```
4
12
```

### Explanation

Perform the following  $q = 2$  queries:

1. HackerLand contains  $n = 3$  cities and can be connected by  $m = 3$  bidirectional roads. The price of building a library is  $c_{lib} = 2$  and the price for repairing a road is  $c_{road} = 1$ .

The cheapest way to make libraries accessible to all is to:

- Build a library in city **1** at a cost of  $x = 2$ .
- Build the road between cities **1** and **2** at a cost of  $y = 1$ .
- Build the road between cities **2** and **3** at a cost of  $y = 1$ .

This gives a total cost of  $2 + 1 + 1 = 4$ . Note that the road between cities **3** and **1** does not need to be built because each is connected to city **2**.

2. In this scenario it is optimal to build a library in each city because the cost to build a library is less than the cost to build a road.

There are **6** cities, so the total cost is  $6 \times 2 = 12$ .
